

Transformers Are Optimal Effective Fields

Problem: Deep Learning architectures are often heuristic. "Why Attention?" is unanswered.

Hypothesis: Good models have the least geometric structure necessary (Symmetry Breaking).

The Approach: Treat the layer depth t as time. The Transformer is the optimal path (geodesic) of a particle system minimizing an action $S(\mathbf{X})$.

Axioms

Universality: Taylor expansion of interactions.

Isometry Invariance: Energy depends on intrinsic geometry.

Learnable Hamiltonians: Symmetry is broken only by parameters.

Result

Input: $S(\mathbf{X}) = \int (\text{Kinetic} - \text{Potential}) dt$

Output: The Euler-Lagrange Equation = *The Transformer ODE* $\dot{\mathbf{X}} = \text{MLP}(\mathbf{X}) + \text{Attention}(\mathbf{X})$

	Dynamics Order	Interactions
MLP	(Piecewise) Linear	No
LinearAttn	Cubic	Yes

Renormalization → **NO HIGHER TERMS!**

From Theory to Practice

ReLU → Conic Projection [2]

GLU → Triple-Trace Potential

Softmax Attention → Free Energy Potential

Sparse Attn → Non-commutative corrections

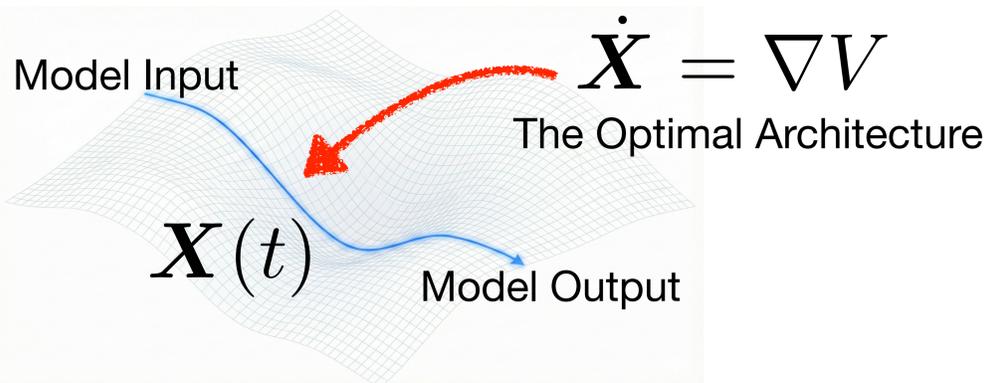

Takeaway: This theory unifies GPT, ResNets, and Diffusion model architectures under a single Hamiltonian framework.
